Balol. Chem. 266:566-6874(1991).

-1 CATALYMIC ACTIVITY: A acylcholine + H(2)O = choline + a carboxylic acid anion.

-1 SUBUNIT: Homoterramer. The tetramer is composed of two dimers. The two subunits in a dimer are linked by a disulfide bond.

-1 TISSUE SPECIFICITY: Present in most cells except erythrocytes.

-1 MISCELLANBOUS: Cholinesterase is highly reactive with
                                                                                                                                                                                                                                                                                                                                                                  organophosphate esters.

Acyl-ester intermediate (By similarity).
Charge relay system (By similarity).
Charge relay system (By similarity).
By similarity.
By similarity.
Interchain (By similarity).
Interchain (By similarity).
N-linked (GlCNAc. .) (Potential).
carboxylic acid anion.
-!- SUBUNIT: Homotetramer. The tetramer is composed of two dimers. The two subunits in a dimer are linked by a disulfide bond (By similarity).
                                                                                                     -!- MISCELLANEOUS: Cholinesterase is highly reactive with organophosphate esters (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (Potential)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CRC64;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pfam; PPO(117) out calls.

California encephalitis serogroup virus LBIV.
Viruses; ssRNA negative-strand viruses; Bunyaviridae; Orthobunyavirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fort P.P., Submitted (JAN-2002) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the type-B carboxylesterase/lipase family.
-!- MISCELLANEOUS: The sequence shown here is derived from an EMBL/GenBank/DDBJ third party annotation (TPA) entry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE=22295875; PubMed=12408673; Vanlandingham D.L., Davis B.S., Lvov D.K., Samokhvalov E., Lvov S.D., Vanlandingham D.L., Davis B.S., Lvov D.K., Samokhvalov E., Lvov S.D., Black W.C., Higgs S., Beaty B.J.; "Molecular characterization of California serogroup viruses isolated

The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function (cognitive function) and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                        This 14-mer peptide corresponds to residues 535-548 of the Actylcholinestrerase mature protein. This peptide is known to act alone or in synergism with a fragment of beca-amyloid to contribute to neuronal degeneration. Compounds that inhibit the biological activity of the novel apptides, and antibodies, can be used to control cytoplasmic calcium ion currents in vivo, and are useful for treating disorders of the central nervous system (e.g. Parkinson's and Alzheimer's diseases), stroke and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Acetylcholinesterase; AChE; neurodegenerative disease; brain; neurological disorder; Alzheimer's disease; Parkinson's disease; motor neuron disease; prion-related disease; NMDA; N-methyl-D-aspartate;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to use of the 14 mer Synaptica peptide (an active fragment of acetylcholinesterase) or its amyloidogenic variant capable of fibril formation, in screening a compound for ability to inhibit amyloidtype fibril formation by the Synaptica peptide. The peptide is useful for screening a compound for the ability to inhibit amyloid-type fibril formation, for preparing a compound by identifying an inhibitor of fibril formation and for determining whenther a peptide or poppide. The peptide is also useful for determining whether variants peptide. The peptide is also useful for determining whether variants will decrease surface tension in aqueous solution. The compounds detected are used for treating Alzheimer's disease, Parkinson's disease and motor neuron disease. Sequences ABG65979-ABG66050 represent human Synaptica peptide variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, acetylcholinesterase; Synaptica peptide; enzyme; AChB; amyloid; acetylcholinesterase; fibril formation; surface tension; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease;
cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus respents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervous system damage, which is an order of magnitude greater than that of the neurotoxin NMDA (N-methyl-D-aspartate). The lesions produced can be identified using simple behavioral tests known to be affected by hippocampal dysfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel use of the 14 mer synaptica peptide, or its amyloidogenic variant capable of fibril formation, in screening a compound for ability to inhibit amyloid-type fibril formation by the peptide.

The invention relates to antibodies which recognise acetylcholinesterase (AChE) or a C-terminal peptide thereof (particularly AAB48914-B48916).
The ACHE splice variant, ACHE-R, and ACHE-R mRNA, have been found to be elevated in response to central nervous system (CNS) insults. The elevated in response to central nervous system (CNS) insults. The invention therefore also relates to a method for diagnosing CNS stress, and also elevated glucocorticoid levels, disruption of the blood-brain barrier or Alzhaimer's disease using a sample (e.g., serum or cerebrospinal fluid) and an antibody of the invention. The CNS stress which may be diagnosed using the antibodies is preferably that caused by psychological insult, physical insult (head injury, head trauma, or exposure to irradiation) or chemical insult (exposure to insecticide or nerve gas). The present sequence represents a human ACHE C-terminal peptide which is specifically claimed as an epitope which is recognised by an antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                    Antibody specific to acetylcholinesterase or its C-terminal peptide derivative useful for diagnosing, ventral nervous system stress, elevated glucocorticoid level, disruption of blood-brain barrier and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ASP-1; haemostatic; acetylcholinesterase; AChE; cell growth; human; cell differentiation; thrombocytopenia; post-irradiation condition; post-chemotherapy condition; blood loss; stress-induced male infertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                 The present sequence is a C-terminal peptide of acetylcholinesterase (AChB). This peptide is acetylcholinesterase "synaptic" peptide (ASP-1). This peptide has a cell growth and/or cell differentiation activity. The peptide may be used in ex vivo or in vivo expansion of haematopoietic stem cells and neural progenitors, and in the promotion of megakaryocytic differentiation of hematopoietic stem cells. In addition, the present peptide may be used in for promoting expansion of committed neural progenitors in a developing embryo, in cultured embryonic stem cells, and embryoid bodies derived from them. The present peptide may further be used in the treatment of thrombocytopenia, post-irradiation conditions, post-chemotherapy conditions, and conditions following massive blood loss, in inducing synthesis of AChB mRNA, and in promoting formation of hematon bodies. Antibodies directed against the present peptide are useful for diagnosing stress-induced male infertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           scFv; AChB-S; heavy chain variable region; muscle re-innervation; progressive neuromuscular disorder; muscle distortion; myasthenia gravis; neuromuscular junction abnormality; baton-Lambert disease; muscular dystrophy; amyotrophic lateral sclerosis; ALS; post-tranuatic stress disorder; PTSD; multiple sclerosis; Dystonia; post-stroke sclerosis; post-injury muscle damage; excessive re-innervation.
                                                                                                                                                                          New regulatory peptides having cell growth and cell differentiation activity derived from the C-terminal region of acetylcholinesterase useful in promoting growth, survival and differentiation of stem cells.

The invention relates to a nucleic acid sequence coding for a single-
chain variable fragment (scFv) antibody that has specific affinity for
chain variable fragment (scFv) antibody that has specific affinity for
the synaptic variant of acetylcholinesterase (ACDE-S), where the scFv
antibody consists essentially of a polypeptide comprising the binding
corrion of the heavy chain variable region of an antibody. Also included
are an expression vehicle comprising a nucleic acid sequence coding for a
scFv antibody that has specific affinity for the synaptic variant of ACHE
cs, an scFv antibody specifically recognising and binding to the synaptic
variant of ACHE-S and a method for the diagnosis of a progressive
cut mammal and detecting intensified expression of at least one of the
ACHE variants in the sample. The single-chain Fv antibody is useful for
diagnosing a progressive neuromuscular disorder which involves any one of
muscle distortion, muscle re-innervation and neuromuscular junction (NMJ)
chormalities. The disorder is Mysethenia gravis (preferred), Eaton-
Lambert disease, muscular dystrophy, amyotrophic lateral sclerosis (ALS),
cspost-trammatic stress disorder (PTSD), multiple sclerosis, post-injury muscle damage, excessive re-innervation,
cropost-exposure to ACHE inhibitors The present sequence represents the
correct of human acetylcholinesterase encoded by a synaptically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                       Nucleic acid sequence coding for a single-chain variable fragment (scrv) antibody that has specific affinity for the synaptic variant of acetylcholinesterase (AChB-S). Useful for diagnosing a neuromuscular disorder, e.g. Myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Acetylcholinesterase; AChE; neurodegenerative disease; brain;

The peptide is used in a method of providing an animal model for a neurodegenerative disease. This method of providing an animal model for a neurodegenerative disease. This convolves introducing the peptide fragment, from close to the C. terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to model for Alzheimer's disease and determining whether the agent to model for Alzheimer's disease impairment of the testable brain function in inhibit, prevent or decrease impairment of the testable brain function and/or cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervous system damage, which is an order of magnitude greater than that neurotoxin NMDA (N-methyl-D-aspartate). The lesions produced can

The sequence represents the amino acid sequence of a biologically active fragment of mouse acetylcholinesterase (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is indicative of a neurological disorder in a human. The animal model is consequenced an early an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent will model for Alzheimer's disease and determining whether the agent will connitive function) and/or cause impairment of the testable brain function (cognitive function) and/or cause impairment of the testable brain function (cognitive function) and/or cause impairment of the testable brain function callular damage in the brain. The animal models are also useful as a codel for Parkinson's disease. Motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable between the neurocoxin NMDA (N-methyl-D-aspartate). The lesions produced can be identified using simple behavioral tests known to be affected by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The sequence represents the amino acid sequence of a biologically active fragment of human acetylcholinesterase (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C- terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function complicative function) and/or cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervous system damage, which is an order of magnitude greater than that the contine the prain in the brain in the prain in the prain in the contine to a sessent the causes considerable nervous system damage, which is an order of magnitude greater than that the contine the prain in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase (ACHE) polypeptide fragment (Synaptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identified by means of inhibition by a blocker of (I). Methods for identified by means analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for the preparation of a medicament for the neurological disorder associated with non-enzymatic action of ACHE, where the neurological disorder is Alzhehmer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of mouse ACHE polypeptide containing the synaptica peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
             Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alpha 7 nicotinic receptor; acetylcholinesterase; AChE; synaptica; antiparkinsonian; nootropic; neuroprotective; Alzheimer's disease; Parkinson's disease; motor neuron disease.

                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                     d
                                                                                                                                                                                                                                                                                                                                                 The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase (AChE) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChE, where the neurological disorder is Alzheimer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-motor neuron disease. It is useful for inhibiting or preventing non-motor neuron disease. It is useful for inhibiting or preventing non-represents the partial sequence of human AChE polypeptide containing the synaptica peptide fragment
                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase

(AChE) polypeptide fragment (Synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identified by means of inhibition by a blocker of (I). Methods for are also provided. The identified functional analog or antagonist a gree also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChE, where the neurological disorder is alzaeimer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of rat AChE polypeptide containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of a human acetyl-cholinesterase (ACHE) variant used in the method of the invention, where inhibitors of ACHE are unsed to treat injury to the central nervous system (CNS). The ACHE inhibitor can also be used to facilitate transplantation of neuronal cells to the CNS of a patient. The inhibitor can also be used to improve hippocampal neuron survival following injury to the CNS. The CNS injuries that can be treated with the method include epilepsy, stroke, Huntington's disease, head injury, spinal injury, pain, Parkinson's disease, myelin deficiencies, neuromuscular disorders, neurological pain, amyotrophic lateral sclerosis, Alzheimer's disease, and affective

                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a C-terminal fragment of the human acetylcholine esterase splice variant E1-4,6. The AChE E1-4,6 variant comprises of residues encoded by exons 1-4 of AChE linked to residues encoded by the alternatively spliced AChE exon 6. The invention claims for the human acetylcholine esterase-14 (AChE-14) readthrough splice variant (AMM48797). The invention provides a pharmaceutical composition, for facilitating passage of compounds through the blood/brain barrier (BBB), comprising of AChE-14, I4 peptide (see AAW48797) or AChE-14 and pharmaceutically acceptable carrier. The pharmaceutical composition is claimed to facilitate a reversible disruption of the BBB allowing transport of compounds through the BBB. The compounds compounds through the BBB. The compounds to compounds through the BBB. The compounds to compounds through the BBB. The compounds to be useful for the diagnosis and treatment of diseases or disorders of the CNS such as infections, neurochemical disorders, brain tumours, gliomas, etc

C. (ACME) splice variant. The invention provides sequences shown in AAV41278 to AAV41285 that represent synthetic nuclease resistant antisense colisodeoxymucleotides which are capable of selectively modulating human acetylcholinesterase (ACME) production. These oligonucleotides are capable of selectively modulating human ACME production in a splice variant of ACME mRNA and are capable of selectively modulating human ACME production in the central nervous system and neuromuscular junction. The invention also provides a method for determining the efficacy of these human ACME specific antisense oligonucleotides. These antisense oligonucleotides can be used to restore balanced cholinergic signalling in the brain, particularly related to learning and memory as well as stress disorders, Parkinson's and Alzheimer's disease. The oligonucleotides work effectively at low therefore deposition of ACME in the neuromuscular junctions of patients therefore deposition of ACME in the neuromuscular junctions of patients chess while avoiding many of the side effects associated with Tacrine and related cholinergic drugs for Alzheimer's disease and pyridostigmine and related drugs for myasthenia gravis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence represents the amino acid sequence of a biologically active fragment of bovine acetylcholinesterse (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C-terminus of AChE, or an active variant of the peptide, into one or more sites in degeneration of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is neurodegenerating an agent for biological activity in a neurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and decermining whether the agent to a inhibit, prevent or decrease impairment of the testable brain function
                                                                                                                                                                                                                                                                                                                                    Acetylcholinesterase; AChE; neurodegenerative disease; brain; neurological disorder; Alzheimer's disease; Parkinson's disease; motor neuron disease; prion-related disease; NMDA; N-methyl-D-aspartate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (cognitive function) and/or cause improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for treatment of Parkinson's disease. The AChE peptide causes considerable nervotoxin NWDA (N-methyl-D-aspartate). The lesions produced can be identified using simple behavioral tests known to be affected by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 87; DB 4; Length 53; 100.0%; Pred. (SYNA-) SYNAPTICA LID.

```
The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antegonist of an acetylcholinesterase (ACHE) polypeptide fragment (Synaptida peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for identifying a functional analog or antagonist of the synaptica peptide are also provided. The identified functional analog or antagonist is careful for the preparation of a medicament for treatment of a neurological disorder is Alzhaimer's disease, Parkinson's disease or the neurological disorder is Alzhaimer's disease, Parkinson's disease or motor neuron disease. It is useful for inhibiting or preventing noncenzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of bovine ACHE polypeptide containing the synaptica peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
Use of alpha 7 nicotinic receptor or its functional analog to determine if a compound is capable of acting as functional analog or antagonist of acetylcholinesterase polypeptide for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence represents the amino acid sequence of a biologically active fragment of rabbit acetylcholinesterase (AChE). The peptide is used in a method of providing an animal model for a neurodegenerative disease. This involves introducing the peptide fragment, from close to the C-terminus of AChE, or an active variant of the peptide, into one or more sites in the brain of a non-human animal, whereby the peptide causes cellular degeneration and leads to impairment of testable brain function that is indicative of a neurological disorder in a human. The animal model is useful for testing an agent for biological activity in a meurodegenerative disorder which involves administering the agent to a model for Alzheimer's disease and determining whether the agent will inhibit, prevent or decrease impairment of the testable brain function combibit, prevent or decrease improvement or deterioration of cellular damage in the brain. The animal models are also useful as a model for Parkinson's disease, motor neuron disease and prion-related diseases and thus for testing reagents to asses their potential for parkinson's disease. The AChE peptide causes considerable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Providing animal model for Alzheimer's disease comprises introducing peptide fragment from close to C-terminus of acetylcholine esterase which causes cellular degeneration and impairment of testable brain function.
                                                                                                                                                                  nceryicmoinnesterase; AChE; neurodegenerative disease; brain; neurological disorder; Alzheimer's disease; Parkinson's disease; motor neuron disease; prion-related disease; NMDA; N-methyl-D-aspartate; hippocampal dysfunction; rabbit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nervous system damage, which is an order of magnitude greater than that of the neurotoxin NMDA (N-methyl-D-aspartate). The lesions produced can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           be identified using simple behavioral tests known to be affected by hippocampal dysfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 87; DB 4; Length 54; 100.0%; Pred. The invention relates to the use of an alpha 7 nicotinic receptor (I) or its functional analog to determine whether a compound is capable of acting as a functional analog or antagonist of an acetylcholinesterase (achs) polypoptide fragment (synaptica peptide) on (I). If (I) is a native alpha 7 nicotinic receptor in its normal membrane environment, it is identified by means of inhibition by a blocker of (I). Methods for alcentified by means of inhibition by a blocker of (I). Methods for are also provided. The identified functional analog or antagonist is useful for the preparation of a medicament for treatment of a neurological disorder associated with non-enzymatic action of AChE, where the neurological disorder is Alzheimer's disease, Parkinson's disease or metor neuron disease. It is useful for inhibiting or preventing non-enzymatic activity of the synaptica peptide in vivo. The present sequence represents the partial sequence of rabbit AChE polypeptide containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Acetylcholinesterase protein #2 used in a yeast two-hybrid system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to C-terminal peptides of acetylcholinesterase (AChE) (see AAB50032-B50034). The peptides of the present invention have call growth and/or call differentiation activity. The peptides may be used in ex vivo or in vivo expansion of naematopoietic stem calls and neural progenitors, and in the promotion of megakryocytic differentiation of hematopoietic stem calls. In addition, the peptides may be used in for promoting expansion of committed neural progenitors in a developing embryo, in cultured embryonic stem calls, and embryoid bodies derived from them. The peptides may further be used in the treatment of thrombocytopenia, post-irradiation conditions, post-chemotherapy conditions, and conditions following massive blood loss, in inducing synthesis of AChE mRNA, and in promoting formation of hematon bodies. Antibodies directed against the peptides are useful for cliagnosing stress-induced male infertility. The present sequence is a C-terminal AChE "synaptic" protein (ASP), which was used in a yeast two-pybrid system, to screen for ARP binding partners
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                         cell differentiation; thrombocytopenia; post-irradiation condition; post-chemotherapy condition; blood loss; stress-induced male infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nervous system; drug assay; acetylcholinesterase; AChE; brain; isoform variance; AChE blocker; muscarinic receptor; M1; M2; pyridostigmine; muscarinic receptor blocker; scopolamine; M1 receptor blocker; pirenzeptine; arxiety; post-traumatic stress; Alzheimer's disease; muscle malfunctioning; neurodegenerative disorder; xenoblotic damage; panic; neuromuscular disorder; parkinson's disease; Huntington's chorea; muscle fatigue; multiple chemical sensitivity; autism; multiple sclerosis; Sjogren's disease; GFP; pGASP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New regulatory peptides having cell growth and cell differentiation activity derived from the C-terminal region of acetylcholinesterase useful in promoting growth, survival and differentiation of stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GFP-fused AChE variant expression construct, pGASP related protein.

The present invention relates to a method and system for evaluating an. effect on the nervous system of a test drug. The method comparises comparing the effect of the drug on acetylcholinesterase (AChE) catalytic activity or isoform variance in a brain of a test animal following a cativity or isoform variance in a brain of a test animal following a challenge by an AChE blocker or a blocker of AChE and muscarinic receptors MI and M2 (e.g. pyridostigmine) and comparing this effect with that of a known agent, preferably a non-selective muscarinic receptor C chack (e.g. scopolamine) or a specific MI receptor blocker (e.g. piranzepine). The method is useful for evaluating an effect on the carvous system of a test drug, including drugs for the treatment of anxiety conditions, post-traumatic stress, Alzheimer's disease, muscle malfunctioning, neurodegenerative disorders, damage resulting from exposure to xenobiotics, panic, neuromuscular disorders, Parkinson's disease. Huntington's chorea, muscle farigue, multiple chemical sequence represents a protein described in relation to green fluorescent protein (GPP)-fueed AChE variant expression construct pGASP
Evaluating effect of drugs on nervous system by comparing effect of drug on acetylcholinesterase, AChE activity in brain of test animal following challenge by AChE blocker and comparing it with control group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Neuroprotective; Cerebroprotective; Anti-HIV; Antiallergic; Antiinflammatory; Thyromimetic; Gene therapy; Antiallergic; cell proliferative disorder; cancer; atherosclerosis; neurological disorder; epilepsy; Huntington's disease; stroke; immune disorder; inflammatory disorder; AIDS; allergies; developmental disorder; Hypothyroidism; Cushing's syndrome; infection; ENZM-28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                            Tang YT;
                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human enzymes (ENZM-1 - ENZM-46, ADL90191-ADL90235) and their coding sequences (ADL90237-ADL90282). The sequences are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of the enzymes, such as cell proliferative (e.g. cancer, atherosclerosis), enveropogical (e.g. epilepsy, Huntington's diseases, stroke), immune/inflammatory (e.g. ADLS, allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections
                                                                                                                                                                                                                                                                                                                       New human enzymes (ENZM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant ENZM expression e.g. cancer, AIDS, epilepsy, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene therapy; human diagnostic and therapeutic polynucleotide; dithp.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human cliagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used in molecules, e.g. cell proliferative disorder, endocrine disorder, neurological disorder, developmental disorder, or infections caused by virus, bacteria, fungi or parasite. The dithp confections and slae be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Organophosphorous poisoning; OP; cancer; leukaemia; megakaryocytopoiesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gietzen D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnostic and condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.

JSY;
GD. Favero KD;
disclosed is the gene sequence encoding the protein. The cDNA is 1936 bp in length and the protein is composed of 526 amino acid residues. The process for preparing the protein and nucleic acid sequence, the process for detecting the AR-ARDE nucleic acid sequence and polypeptide in a sample, and the process for promoting or inhibiting cell withering are also disclosed. The current sequence represents the human acetylcholinesterase isomer protein amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human; enzyme; ENZM-9; immunosuppressive; antiinflammatory; antimicrobial; neuroprotective; cardiovascular; ophthalmological; gynaecological; cytostatic; gene therapy; immune deficiency; autoimmune disorder; inflammatory disorder; infectious disorder; neurological disorder; cardiovascular disorder; eye disorder; metabolic disorder; reproductive disorder; cell proliferative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New enzymes, useful for diagnosing, treating, or preventing autoimmune, inflammatory, infectious, neurological, cardiovascular, eye, metabolic, reproductive, or cell proliferative disorders including cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human enzyme designated ENZM-9. Human
ENZM sequences have immunosuppressive, antiinflammatory, antimicrobial,

Human acetylcholinesterase (EC-3.1.1.7) is accumulated at neuromuscular junctions where it serves a vital function in modulating cholinergic neurotransmission. Alternatively spliced forms of human AChE may be expressed in transgenic animals which are used in an assay system for determining the anti-ChE activity of organophosphates, carbamates, anti-ChE drugs, plant glycoalkaloids and snake venoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides a method of enhancing organophosphate detoxifying
                                                                                                                                                                                                         Alternative forms of human acetyl cholinesterase (ChE) gene - expressed in transgenic animal assay system for evaluating anti-ChE activity of organo:phosphate(8), etc. or as model of ChE imbalance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enhancing the organophosphate detoxifying capabilities of esterases for the treatment of organophosphate poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Organophosphate; detoxification; esterase; acetylcholinesterase; AChE; butrylcholinesterase; BuChE; carboxylesterase; CaE; sheep dip; human; nerve agent; organophosphorus acid anhydride; OPAA; mutant.

The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (AChE), human butrylcholinesterases (BuChE) and/or carboxylesterases (GEE), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CaE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to creat military personnel contaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphates. The method produces esterases with cimproved detoxification properties over naturally occurring organophosphates. They are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (AChE), human butrylcholinesterases (BuchE) and/or carboxylesterases (CaE)), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuchE and/or human CaE). The modified esterases may through contact with chemical workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel conteminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        organophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also less likely to be inactivated by the OPAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enhancing the organophosphate detoxifying capabilities of esterases for the treatment of organophosphate poisoning.

capabilities of esterases (aither human acctylcholinesterases (ACHE), thuman butrylcholinesterases (aither human acctylcholinesterases (ACHE), that comprises substituting a histidine residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human ACHE, human BuCHE and/or human CaE). The modified esterases (either human ACHE, human BuCHE and/or human CaE). The modified esterases (either through contact with chemical workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or contaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring corganophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also less likely to be inactivated by the OPAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                               The invertion by overtices a method of entertaint capabilities of esterases (BuChE) and/or carboxylesterases (AChE), human butrylcholinesterases (BuChE) and/or carboxylesterases (AChE), that comprises substituting a histidiane residue for 1 or more amino acid(s) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CaE). The modified esterases (either them be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat agricultural sa sheep dips. They may also be used to treat agricultural sesses may also be used to the esterases military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or decontaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also resulted to be inactivated by the OPAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                      The invention provides a method of enhancing organophosphate detoxifying
                                                                                                                                                                                                                                                                                    Enhancing the organophosphate detoxifying capabilities of esterases for the treatment of organophosphate poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Organophosphate; detoxification; esterase; acetylcholinesterase; AChB; butrylcholinesterase; BuChB; carboxylesterase; CaB; sheep dip; human; nerve agent; organophosphorus acid anhydride; OPAA; mutant.

The invention provides a method of enhancing organophosphate detoxifying capabilities of esterases (either human acetylcholinesterases (ACBE), that thuman butrylcholinesterases (BuChE) and/or carboxyleaterases (GAE), that comprises substituting a histidine residue for 1 or more amino acid(a) within 6 Angstrom of an active site serine. The method may be used for enhancing organophosphate detoxifying capabilities of esterases (either human AChE, human BuChE and/or human CaE). The modified esterases may then be used to treat agricultural workers poisoned with organophosphates through contact with chemical such as sheep dips. They may also be used to treat military personnel contaminated by chemical weaponry such as nerve agents. Additionally, the esterases may also be used to decontaminate ground and buildings and equipment used to store, or decontaminated by organophosphates. The method produces esterases with improved detoxification properties over naturally occurring organophosphorus acid anhydride (OPAA) hydrolyzing enzymes. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

New polymorphic variants comprising acetylcholinesterase (ACHE) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological

diseases or cancer.

```
The invention relates to a polynucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene of the nonhuman organism stransformed or transfected with the polynucleotide where the organism expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence, an isolated antibody specific for and immunoreactive with ACHE, a method of screening of or drugs targeting the polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by chaplotypes 1-20 given in the specification. The Polymorphisms are useful for studying the biological function of ACHE as well as in identifying drugs targeting this protein for the treatment of disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for pumping ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.g. condition or disease predicted to be associated with ACHE activity e.g. concurred lawsaming and tumours and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The invention relates to a polynucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE jengene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene of an at least one haplotype or haplotype pair of ACHE gene of an encloded by the polymorphic variant sequence or encoded by the polymorphic variant sequence, an isolated antibod specific for and immunoreactive with ACHE, a method of screening for drugs targeting the polymorphic variant with a candidate agent and assaying for binding activity, a computer with a candidate agent and assaying for binding activity, a computer geneme anthology for ACHE gene which comprises ACHE isogenes defined by haplotypes 1-20 given in the specification. The Polymorphisms are useful activity that the biological function of ACHE as well as in identifying drugs targeting this protein for the treatment of disorder related to its abnormal expression or function. The polymorphic variant may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 used in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e.g. neurological diseases (e.g. Parkinson's disease and Alzheimer's disease) cancer, leukaemia, and tumours. The ACHE gene maps to human chromosome 7q22. The present sequence is an ACHE protein polymorphic variant. Note: The present sequence is not shown in the specification but was created by the indexer from the ACHE sequence shown in figure 3 (AAU11231)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ACHB; acetylcholinesterase; polymorphic variant; haplotyping; genotyping; neurological disease; Parkinson's disease; Alzheimer's disease; cancer; leukaemia; tumour; chromosome 7g22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The invention relates to a polymuclectide comprising a polymorphic variant of an acetylcholinesterase (ACHS) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genocitype pair for the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait and at least one haplotype or haplotype pair of ACHE gene, recombinant conhuman organisms transformed or transfected with the polymuclectide where the organism expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence, an isolated attibody specific for and immunoreactive with ACHE, a method of screening for drugs targeting the polymorphic waith ACHE, a method of screening for strain anthology for ACHE gene which comprises ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by the polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by the polymorphism are useful for studying the biological function of ACHE as well as in identifying the protein for the treatment of disogene to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting ACHE to treat a specific conduction or flasease predicted to be associated with ACHE activity as conducted to the conduction of disease and Alzheimer's disease condition or disease specification. The polymorphic variants may also be condition or disease specification or disease ent sequence is an ACHE gene maps to human chromosome conduction and tumours. The ACHE gene maps to human chromosome and present sequence is an ACHE gene maps to human chromosome and present sequence is an ACHE gene against and a server of the present sequence is not shown in the specific cancer. The present sequence of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is not shown in the specification but was created by the indexer from the ACHE sequence shown in figure 3 (AAU11231)
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polymorphic variants comprising acetylcholinesterase (ACHB) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The invention relates to a polynucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotypes and paplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait on nonhuman organisms transformed or transfected with the polymorleotide where the organism expresses ACHE protein encoded by the first nucleotide where the organism expresses ACHE protein encoded by the polymorphic variant sequence, an isolated activity as computer continuant organisms transformed protein encoded by the polymorphic variant sequence or encoded by the polymorphic variant sequence, an isolated activity activity a computer sequence or encoded by the polymorphic variant sequence, an isolated continuant organisms expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polymorphic variant sequence or encoded by the polymorphic variant sequence or encoded by the polymorphism for binding activity, a computer or system for storing and analysing polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by the polymorphic and analysing polymorphic protein activity and analysing polymorphic variants may also be condition or disease predicted to be associated with ACHE activity e.g. condition or diseases (e.g. Parkinson's disease and Alzhelmer's disease), cancer, leukaemia, and tumours. The ACHE gene maps to human chromosome 7q22. The present sequence is an ACHE protein polymorphic variant. Note: The present sequence is not shown in the specification but sequence is not shown in the specification but the sequence of bolymorphic variants may also be a polymorphic variant or the polymorphic variant of the present sequence is not shown in figure 3 (AAU11231)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polymorphic variants comprising acetylcholinesterase (ACHE) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological
                    Human; ACHE; acetylcholinesterase; polymorphic variant; haplotyping; genotyping; neurological disease; Parkinson's disease; Alzheimer's disease; cancer; leukaemia; tumour; chromosome 7q22.

The present invention relates to novel human drug metabolising enzymes,

DME-1 to DME-13 (ABP59210-ABP59222) and their coding sequences (ABZ81301-
ABZ81313). The sequences are useful for diagnosaing, treating or

preventing disorders associated with aberrant expression of DME,

particularly cell proliferative disorders (e.g. arteriosclerosis,

catherosclerosis, cirrhosis, parcxysmal nocurnal neamoglobinuria,

catherosclerosis, poriasis, primary thrombocytopenia or cancer,

developmental disorders (e.g. renal tubular acidosis, anaemia or mental

cetardation), endocrine (e.g. renal tubular acidosis, anaemia or mental

cretardation), endocrine (e.g. reteoporosis, thrombosis, diabetes), eye

disorders (e.g. glaucoma, keratitis), metabolic (e.g. hyperlipidaemia,

cystic fibrosis), gastrointestinal disorders (e.g. pastroenteritis,

cautoimmune/inflammatory disorders (e.g. hppatitis, Reye's syndrome), or

autoimmune/inflammatory disorders (e.g. AIDS, allergies, asthma,

cautoimmune/inflammatory disorders (e.g. AIDS, allergies, asthma,

cautoimmune/inflammatory disorders (e.g. AIDS, allergies, asthma,

cautoimmune thyroiditis, contact dermatitis, Crohn's disease,

dlashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis,

osteoarthritis, pancreatitis, Reiter's syndrome, multiple sclerosis,

coffects of exogenous compounds on the expression of nucleic acid and

amino acid sequences of DME. The polynucleotides encoding DME are useful

correcting transgenic animals to model human disease
                                                                                                                                                                                                          Human; drug metabolising enzyme; anti-HIV; antiallergic; antidiarrheic; antinflammatory; antianaemic; thrombolytic; antilipaemic; antidiarrheic; antiantiarchic; antiantendecic; antiantiarchic; antiantiarchic; immunosuppressive; antidiabetic; cytostatic; hepatotropic; virucide; dermatological; antidiabetic; antiarchritic; antipout; neuroprofective; thyromimetic; osteopathic; antiarthritic; antipsoriatic; uropathic; ophthalmological; antirheumatic; developmental disorder; endocrine disorder; cancer; metabolic disorder; gastrointestinal disorder; liver disorder; autoimmune disorder; liver disorder; autoimmune disorder; liver disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New drug metabolizing enzymes (DME) useful for diagnosing, treating or preventing diseases or conditions associated with aberrant DME expression, e.g. cancer, AIDS, atherosclerosis, diabetes, glaucoma, hepatitis or osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Griffin JA, Ramkumar J, Emerling BM, Richardson TW, Li JX; warren BA, Honchell CD, Baughn MR, Tang YT, Lee EA, Elliott VS Yue H, Lee S, Swarnakar A, Forsythe IJ, Sanjanwala MM, Yao MG; Zebarjadian Y, Gorvad AE, Becha SD, Burford N;
                                                                                                                                                                  Human drug metabolising enzyme, DME-13, SEQ ID 13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 168-169; 181pp; English.

The present sequence represents human acetylcholinesterase (YT blood group). Single cell biosensors of the invention which overexpress the muscarinic receptor are used to detect acetylcholinesterase inhibition.

The muscarinic receptor is a G protein-coupled receptor (GPCR) that translocates arrestins. The specification describes a single cell biosensor comprising a cell which overexpresses arrestin and at least one GPCR, the arrestin or the cell is detectably labeled for monitoring internalisation of the GPCR. The biosensor detects various bioreactive ligand species in the sample, as opposed to other antibody-based methods, such as radioimmunoassay, which detects only the ligand species with the reactive epitope. The biosensor is useful for detecting a GPCR ligand in a test sample, for monitoring a GPCR ligand in a mammal, for detecting a compound which modulates a GPCR ligand in a test sample, cor monitoring a GPCR ligand in a test sample, cor monitoring a GPCR ligand in a test sample, cor monitoring a GPCR ligand in a test sample, cor continuous screening of GPCR ligands in a test sample, cor continuous screening of GPCR ligands in a test sample, cor sample. It is useful for altering GPCR internalisation. It is also useful cor for continuous and cor sample. It is useful for altering GPCR internalisation. It is also useful

compound that regulates the activity of one of more of the polynuclectides, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymorlectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form mark of the printed specification, but was obtained in electronic form directly from WIPO at the print of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allalic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the continuous continuous and animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain, a method for identifying a compound animal subjected to pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Woolf C, D'urso D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2003-268312/26.
